SUMMARY

I find the work that should not be done by hand, decide what to automate and where a human must stay in control, then own the automation from discovery through deployment and monitoring. Since 2025 I have run Aldeazz AI Lab, where 15 production services and 20 scheduled jobs carry out operations, CRM and outreach, research and publishing work every day.

I operate an AI-native development environment where specialized agents handle much of the implementation execution. I own requirements, architecture, orchestration, evaluation, deployment, monitoring and production decisions. Before that, seven years as Deputy CEO and Chief Legal Officer of a regional e-government operator taught me to understand the process and its owners first, then change it.

15 production services · 20 scheduled jobs

11,000+ job postings screened

2,800+ CRM deals · 2,100+ companies

2,432 → 73 emails matched to deals

420+ AI-visibility audits

600+ automated tests

7 yrs Deputy CEO & CLO

EXPERIENCE

Founder & AI Product and Operations Lead — Aldeazz AI Lab · Panama / Remote · 2025–Present

Founder-led AI lab. I map the processes, decide what gets automated, and own every automation in production; specialized AI agents carry much of the build.

Automations shipped end to end — still running

- **Reply detection (inbox → CRM).** Reads two inboxes and matches every sender against the CRM. Replayed on 60 days of real mail, it narrowed 2,432 emails to the 73 from people linked to a deal, including a prospect's reply that had sat unseen for nearly eight weeks. Live, it checks every 10 minutes and alerts me with the deal linked.
- **Approved-send outreach loop (GTM).** Agents research, qualify and draft; one human approval sends, moves the deal, stamps delivery and books the follow-up in HubSpot. 2,800+ deals, 1,300+ contacts, 2,100+ companies. The send is fail-closed: if an attachment fails to load, the email is refused rather than claiming a document it does not carry.
- **Inquiry concierge (Make + Claude, with a backup).** Website form and chat inquiries reach HubSpot at once; a Make.com scenario has Claude draft the reply, and the email goes out only after a one-tap human approval. When Make's AI credits ran out and drafts silently stopped, I added a backup: my server now drafts on a five-provider chain if Make has not answered in time, so an inquiry is never left unanswered. Published as a case study.
- **Sourcing and screening pipeline.** Has screened 11,000+ job postings: hard rules (location, pay) filter first, an AI model scores the rest, and it learns from the decisions I record in the CRM.
- **Morning briefing and completeness audit.** A daily priority queue replaced opening records one by one; a read-back audit checks every priority deal against a six-part standard and alerts on any gap.

Monitoring and reliability — what breaks quietly

- Found trial sign-ups that had never reached the CRM since launch, while the sender's log looked healthy. I audited from the receiving end, fixed it and backfilled all 28 lost users.
- Found a spending cap that could never fire: the budget guard read a price field the vendor never sends. Fixed it against the vendor's real response and published the postmortem.
- When a vendor retired the AI models my services used, I moved all six products onto a five-provider fallback chain that week, with no outage.
- 600+ automated tests across unit, integration and evaluation layers.

Measurement — prove it worked, not that it ran

- Every change to the AI scoring step is tested against a set built from my own past decisions before it goes live. A more complex upgrade scored lower, so I kept it switched off.
- Outcome labels showed one role category made up 7 of the 12 postings I rejected but only 2 of the 12 I rated positive; I cut it within a day and re-pointed the searches.
- I judge a data source by its data: one job board had no posting newer than 33 days and 91% past their own expiry, so I rejected it and connected another.

Documentation and adoption

- Set the coordination protocol three AI coding agents follow even though they cannot see each other's chats: claim before touching shared systems, a handoff block on every pause (done / next / verified by / risk), every work product in a file or the CRM.
- 20+ named postmortems in a public [AI Operations Wiki](#), plus a public [AI Operations SOP](#).

Operational Co-Founder — OmniBazaar, decentralized e-commerce marketplace · Remote · 2024–2025

- Led strategic planning and the operational structure for the marketplace.
- Led the legally compliant setup of a DAO LLC in the Marshall Islands, and its governance operations.

Deputy CEO for Corporate Governance & Chief Legal Officer — JSC “E-GOV OPERATOR” · Penza region, Russia · 2011–2018

A ~60-person company moving the delivery of public services into electronic form for the regional government.

- Owned the board process: arranged board meetings and drove the board's decisions through to implementation.
- Made sure every public service the company built in electronic form was lawful under existing legislation, and managed those projects from the legal side.

Deputy CEO, Business Development — Fundery LLC, fintech · Russia · 2017–2018

HOW I AUTOMATE

1. **Define the outcome** and the number that shows it happened.
2. **Map the workflow**: handoffs, repetitive work, failure points, the systems already in place.
3. **Choose the tool**: fixed rules for predictable steps, AI for research, classification and drafting, a human approval where a mistake would cost money, a customer or reputation.
4. **Build and integrate** with the existing systems; **evaluate** against real cases and reject changes that make it worse.
5. **Operate**: deploy, monitor from the receiving end, fix, document.
