PROFILE

I build the systems that carry an idea to finished creative — concept, script, image, motion, sound, assembly and publication — as repeatable workflows, not one-off projects.

Founder of **ATUONA**, a generative film studio with **six finished short films**, each with its own score, narration, generated poster and title cards. A published poet with **98 released works**, so the source material is my own and cleared outright. Creative sensibility with an operator's discipline. Alongside it I design and run **12+ production AI systems** solo — agents, publishing pipelines, quality gates and multi-provider model routing — and I document how they fail, so other people can use them safely.

Before AI: **seven years as Deputy CEO and Chief Legal Officer** of a national digital-transformation programme. I am comfortable in the discovery meeting and in the pipeline.

GENAI CREATIVE PRODUCTION — concept to finished output

ATUONA — generative film studio (atuona.xyz/aifilmstudio) · Founder / Curator · 2019–Present

- **Six finished short films**, published: script by LLM → images → AI video → automated assembly → scored, titled and released. Every release is checked frame by frame before it goes live.
- **Nodal pipeline with persisted intermediate assets**: any single scene can be regenerated and dropped back into the film without rebuilding the other seven — the difference between a fix costing one shot and costing the whole piece.
- **Four-provider fallback for video** (Luma, Runway, Kling, Veo) behind one interface, with model selection per shot, so a provider outage or a refused prompt never stops a delivery.

PRODUCT FILM FOR MY OWN API — brief to broadcast, solo

- Concept, script, generation, edit, soundtrack and publication of a product film for my AI Visibility Audit API: a fruit-sliced-open metaphor for looking inside a website, brand typography taken from the product site, and a **scannable QR code on every shot** so a paused frame reaches the product.
- **Nineteen versions**. Most of the improvement came from watching the output honestly and rejecting shots, not from better prompts.
- Published and then **automated**: a Make.com workflow distributes it on schedule to LinkedIn, Instagram and YouTube, rotating between two cuts so the channel never repeats itself on consecutive days.
- **Bilingual production at volume**: 146 published pages from a daily English/Spanish pipeline — copy, structured data and imagery — plus a daily social-image pipeline for a consumer AI product.

WORKFLOW GOVERNANCE, QUALITY CONTROL & RELIABILITY

- **Two quality gates built after real failures**. The publishing pipeline refuses to publish any number it cannot trace to a verified source, and blocks near-duplicate pieces by comparing each draft against everything already published.
- **A silent fallback is a failure that looks like success**. My pipelines now report which provider actually produced each asset, and quality is judged on the finished frames, not on an exit code.
- **Criteria that live in one place**. An AI screening system was quietly rejecting good work because its rules had drifted across seven locations; I consolidated them into one shared rulebook rendered into every prompt, added **413 automatic tests**, and proved with a replay of 51 rejected items that 20 were wrong — before deploying.
- **Documentation as an artifact, not an afterthought**: a public engineering wiki of **21 production incidents and 18 named failure patterns**, generated from verified records so no model can re-tell an incident.

PLATFORM EVALUATION & TECHNICAL INNOVATION

- Run a **five-provider model chain ordered by use case** (quality, classification, bulk) rather than one default model — continuous, practical evaluation of what each model is actually good for.
- Shipped a public product from that work: the **AI Visibility Audit API** (aideazz.xyz/api) — 34 automated checks in four weighted categories, telling any brand whether ChatGPT, Claude, Perplexity and Gemini can read and recommend its site.
- Measure rather than assume: a weekly automated probe records whether AI answer engines cite a page, name it without a link, or miss it.

ENABLEMENT, CLIENTS & EARLIER CAREER

- **Deputy CEO & Chief Legal Officer**, JSC "E-GOV Operator" (Russia, 2011–2018) — seven years at board level on a large digital-transformation programme across IT, legal and compliance: stakeholder discovery, standards, training and change management in a heavily regulated environment.
- **Operational Co-Founder**, OmniBazaar (2024–2025) · **Deputy CEO, Business Development**, Fundery LLC (2017–2018). Languages: **Russian (native)**, **English (fluent)**, **Spanish (intermediate)**; Panama UTC-5 covers US and European afternoons.

TOOLS, EDUCATION & NOTES

Creative / GenAI: Claude Opus · GPT · Gemini · Flux Pro · Luma Dream Machine · Runway · Kling · Veo · prompt systems · agentic workflows

Systems: Make.com · n8n · HubSpot · Python · TypeScript · JSON-LD · Oracle Cloud · IPFS/Polygon

Education: MA Social Psychology, Penza State University · Presidential Program for Executive Management, RANEPa Moscow · Anthropic Academy, Claude Certification (in progress)

Straight answer: My craft background is generative film and poetry, not an advertising agency, and I work in Flux, Runway, Kling and Claude rather than Adobe Creative Cloud. What I bring is the systems side: building and governing the workflows creative teams rely on.
